# Exercise 1.1

#### Concept corner

### **Definition:**

- ✓ A set is a collection of well defined objects.
- ✓ If *A* and *B* are two non-empty sets, then the set of all ordered pairs (a, b) such that  $a \in A, b \in B$  is called the **Cartesian Product of** *A* and *B*, and is denoted by  $A \times B$ . Thus  $A \times B = \{(a, b) | a \in A, b \in B\}$

#### Note:

- ➤ A × B is the set of all possible ordered pairs between the elements of A and B such that the first coordinate is an element of A and the second coordinate is an element of B.
- >  $B \times A$  is the set of all possible ordered pairs between the element of *A* and *B* such that the first coordinate is an element of *B* and the second coordinate is an element of *A*
- ▶ If a = b, then (a, b) = (b, a).
- > The "Cartesian product" is also referred as "cross product"
- ➤ In general  $A \times B \neq B \times A$ , but  $n(A \times B) = n(B \times A)$
- $\blacktriangleright$   $A \times B = \emptyset$  if and only if  $A = \emptyset$  or  $B = \emptyset$
- ▶ If n(A) = p and n(B) = q then  $n(A \times B) = pq$
- > The set of all points in the Cartesian plane can be viewed as the set of all ordered pairs (x, y) where x, y are real numbers. In fact  $\mathbb{R} \times \mathbb{R}$  is the set of all points which we call as the Cartesian plane.
- > Distributive property of Cartesian product:

(i) 
$$A \times (B \cup C) = (A \times B) \cup (A \times C)$$

(ii)  $A \times (B \cap C) = (A \times B) \cap (A \times C)$ 

→  $A \times B$  represent a shape in two dimensions and  $A \times B \times C$  represent an object in three dimensions.

Exercise 1.2

## Concept corner

**Definition:** Let *A* and *B* be any two non-empty sets. A **relation** (**R**) from *A* to *B* is a subset of  $A \times B$  satisfying some specified conditions. If  $x \in A$  is related to  $y \in B$  through R, then we write it as xRy. xRy if and only if  $(x, y) \in R$ 

- ✓ The domain of the relation  $R = \{x \in A | xRy$ , for some  $y \in B\}$
- ✓ The co-domain of the relation R is B
- ✓ The range of the relation  $R = \{y \in B | xRy, \text{ for some } x \in A\}$

## Note:

A relation may be represented algebraically either by the roster method or by the set builder method.

Exercise 1.3

### Concept corner

**Definition:** A relations *f* between two non-empty sets *X* and *Y* is called a **function** from *X* to *Y* if, for each  $x \in X$  there exists only one  $y \in Y$  such that  $(x, y) \in f$ . That is,  $f = \{(x, y) / \text{ for all } x \in X, y \in Y\}$ **Note:** 

- ✓ If  $f: X \to Y$  is a function then, the set *X* is called the domain, *f* and the set *Y* is called its co-domain.
- ✓ A function is also called as a mapping or transformation.
- ✓  $f: X \to Y$  is a function only if

i) every element in the domain of f has an image.

- ii) the image is unique.
- ✓ If *A* and *B* are finite sets such that n(A) = p, n(B) = q then the total number of functions that exist between *A* and *B* is  $q^p$
- ✓ If f(a) = b, then *b* is called **image** of a under *f* and *a* is called a **pre-image** of *b*.
- ✓ The set of all images of the elements *X* under *f* is called the **range** of *f*.
- ✓ Describing domain of a function
  - (i) Let  $(x) = \frac{1}{1+x}$ . If x = -1 then f(-1) is not defined. Hence f is defined for all real numbers except at x = -1. So, domain of f is  $\mathbb{R} \{-1\}$
  - (ii) Let  $(x) = \frac{1}{x^2 5x + 6}$ , if x = 2,3 then f(2) and f(3) are not defined. Hence f is defined for all real numbers except at x = 2 and 3. So domain of  $f = \mathbb{R} \{2,3\}$
- An arrow diagram is a visual representation of a relation.
- ▶ If n(A) = p, n(B) = q then the total number of relations that exist from A to B is  $2^{pq}$ .
- > A relation which contains no elements is called a "Null relation"

# Exercise 1.4

#### Concept corner

**Note:** Any equation represented in a graph is usually called a curve.

- ✓ Representation of functions
  - a) a set of ordered pairs b) a table form
  - c) An arrow diagram d) a graphical form.
- ✓ Vertical line test: A curve drawn in a graph represents a function, if every vertical line intersects the curve in at most one point.
- ✓ Horizontal Line Test: A function represented in a graph in one one, if every horizontal line intersects the curve in at most one point.
- ✓ Every function can be represented by a curve in a graph. But not every curve drawn in a graph will represent a function.
- ✓ If f: A B is an onto function then, the range of f = B

**Note:** A one-one and onto function is also called a one-one correspondence.

| Sl.No | Name                               | Definition  | Mapping Example   |  |
|-------|------------------------------------|---|---|--|
| 1     | One-One<br>function<br>(Injection) | A function $f: A \rightarrow B$ is called one-one function if distinct elements of $A$ have distinct images in $B$ .  | $\begin{array}{cccc} A & f & B \\ \hline 1 & & a \\ 2 & & b \\ 3 & & c \\ 3 & & c \\ 4 & & f \end{array}$                         |  |
| 2     | Many-one<br>function               | A function $f: A \rightarrow B$ is called many-one<br>function if two or more elements of $A$ have<br>same image in $B$   | $ \begin{array}{cccc} A & f & B \\ \hline 1 & & & a \\ 2 & & & b \\ 3 & & & c \\ 4 & & & c \\ \end{array} $                       |  |
| 3     | Onto function<br>(Surjection)      | A function $f: A \rightarrow B$ is said to be onto<br>function if the range of $f$ is equal to the co-<br>domain of $f$ .   | $ \begin{array}{cccc} A & f & B \\ \hline 1 & & & a \\ 2 & & & & b \\ 3 & & & & c \\ 4 & & & & c \\ \end{array} $                 |  |
| 4     | Into function                      | A function $f: A \rightarrow B$ is called an into<br>function if there exists at least one element<br>in <i>B</i> which is not the image of any element<br>of <i>A</i>                        | $\begin{array}{cccc} A & f & B \\ \hline 1 & & & & a \\ 2 & & & & b \\ 3 & & & & & c \\ 3 & & & & & d \\ 4 & & & & f \end{array}$ |  |
| 5     | Constant<br>function               | A function $f: A \rightarrow B$ is called a constant<br>function if the range of $f$ contains only one<br>element.<br>That is, $f(x) = c$ for all $x \in A$ and for<br>some fixed $c \in B$ . | $ \begin{array}{c} A & f & B \\ \hline a & & & \\ b & & & \\ c & & & \\ d & & & \\ \end{array} $                                  |  |
| 6     | Identity<br>function               | Let <i>A</i> be a non-empty set. Then the function $f: A \rightarrow A$ defined by $f(x) = x$ for all $x \in A$ is called an identity function on <i>A</i> and is denoted by $I_A$ .          | $\begin{array}{cccc} A & f & B \\ \hline x & & & & \\ y & & & & \\ z & & & & \\ \end{array}$                                      |  |
| 7     | Bijection                          | If a function $f: A \rightarrow B$ is both one-one and<br>onto, then $f$ is called a bijection from $A$ to $B$  | $\begin{array}{cccc} A & f & B \\ \hline 1 & & & \\ 2 & & & \\ 3 & & & & \\ \end{array}$  |  |
| 8     | Real – Valued                      | A function $f: A \rightarrow B$ is called a real valued function if the range of $f$ is a   |   |  |
|       | function                           | subset of the set of all real numbers <i>R</i> . That is $f(A) \subseteq R$   |   |  |

# Types of functions

В

# Exercise 1.5

#### Concept corner

**Definition:** Let  $f: A \to B$  and  $g: B \to C$  be two functions. Then the composition of *f* and *g* denoted by  $g \circ f$  is defined as the function

 $g \circ f(x) = g(f(x))$  for all  $x \in A$ .

- ✓ The composition  $g \circ f(x)$  exists only when range of f is a subset of g
- ✓  $f \circ g \neq g \circ f$  Composition of function is not commutative.
- ✓ Composition of three functions is always associative. That is  $f \circ (g \circ h) = (f \circ g) \circ h$ .
- ✓ A function  $f: R \to R$  defined by f(x) = mx + c,  $m \neq 0$  is called a **linear function**. Some specific linear functions and their graphs are given below.

| No. | Function                  | Domain and Definition               | Graph   |
|-----|---------------------------|-------------------------------------|---|
| 1   | The identity function     | $f: R \to R$ defined by $f(x) = x$  | $\begin{array}{c} \begin{array}{c} & AY \\ & 4 \\ & 3 \\ & 2 \\ & 2 \\ & 1 \\ \hline \\$  |
| 2   | Additive inverse function | $f: R \to R$ defined by $f(x) = -x$ | $\begin{array}{c} & & & & & & \\ & & & & \\$ |

✓ A function  $f: R \to R$  defined by  $f(x) = ax^2 + bx + c$  ( $a \neq 0$ ) is called a **quadratic function**.

| Chapter 1 - Relations and Functions 5   |  |  |  |  |
|---|--|--|--|--|
| (   | A function $f: R \to R$ defined by $f(x) = ax^3 + bx^2 + cx + d$<br>( $a \neq 0$ ) is called a <b>cubic function</b> .                           | $\begin{array}{c} & & & \\ & & & & \\ & & & \\ & & & \\ & & & \\ & & & \\ & & & \\ & & & & \\ & & & & \\ & & & & \\ & & & & \\ & & & & \\ & & & & \\ & & & & \\ & & & & \\ & & & & \\ & & & & \\ & & & & \\ & & & & \\ & & & & \\ & & & & \\ & & & & \\ & & & & \\ & & & & \\ & &$ |  |  |
| ľ   | A function $f: R - \{0\} \to R$ defined by $f(x) = \frac{1}{x}$ is called a <b>reciprocal function</b> .   |  |  |  |
| A<br>C  | A function $f: R \to R$ defined by $f(x) = c$ for all $x \in R$ is called a <b>constant function</b> .   | $\begin{array}{c c} Y \\ \hline \\ c \\ \hline \\ \\ \hline \\ \\ \hline \\ \\ \\ \\ \\ \\ \\ \\$  |  |  |
| r<br>j  | Modulus or Absolute Valued Function: $f: R \to [0, \infty)$ defined by<br>$f(x) =  x  = \begin{cases} x \ ; x \ge 0 \\ -x \ ; x < 0 \end{cases}$ | $y = x + \frac{5}{4}$ $y = x + \frac{4}{4}$ $x + \frac{2}{4}$  |  |  |
| ✓ Modulus function is not a linear function but it is composed of two linear functions $x$ and $-x$ |  |  |  |  |
